Data protection and information security

It's not a question of if, but when the company will be hacked!

The increasing digitization and networking of the working world poses fundamental challenges for companies. The threat situation for information security is becoming very dynamic and diverse in companies due to the networking and control of industrial plants, smart homes, the Internet of Things and connected cars.

The DSG (Swiss Data Protection Law) and the GDPR provide for severe, personal penalties for the CEO in the event of violations.

There is a close dovetailing with information security management, as data protection also pursues the protection goals of confidentiality, availability, authenticity and integrity, although the focus of data protection is on personal data and not on protecting the company.

From an operational risk perspective, "event," "cause," and "risk scenario" are synonymous. It therefore makes sense to incorporate the operational risks resulting from data protection into information risk management so that consolidated reporting can be made to the management.

Together with you, we analyze data protection risks and the cyber-attack potential that can result in total loss. With our qualified and experienced partners, we support the procedure with individual core competencies.
